Service is Web-based

GeoEstimator has updated its GeoEstimator service; users now can access the service's features from any computer via a Web browser without downloading software.

GeoEstimator combines aerial and satellite images and is said to calculate precise measurements of virtually any surface, including ridges, valleys, perimeters and step flashings. The Web-based service reportedly allows users to edit slope values, change slope directions and line types, verify measurements and make adjustments. All reports can be saved, edited and generated directly from the Web site, and users still can opt to use the service's software.
